Systems Integration Framework

Tenets of Chef

- Manage servers with code, not command lines.
- Repeatable, documented, and revision controlled.
- Make decisions based on a global view, not just a local one.

Building Blocks

```
cookbooks/  
  cookbook_name/  
    metadata.rb  
    README.rdoc  
    attributes/  
    definitions/  
    files/  
    libraries/  
    recipes/  
    templates/
```

...

Metadata

```
maintainer      "Opscode, Inc."  
maintainer_email "cookbooks@opscode.com"  
license        "Apache 2.0"  
description     "Installs passenger for Apache2"  
long_description IO.read(File.join(File.dirname(__FILE__), 'README.rdoc'))  
version        "0.7"
```

```
%w{ packages ruby apache2 rails }.each do |cb|  
  depends cb  
end
```

```
%w{ redhat centos ubuntu debian }.each do |os|  
  supports os  
end
```

```
attribute "gems_path",  
  :display_name => "Gems Path",  
  :description => "Get the gem env gemdir",  
  :default => "gem env gemdir"
```

...

Recipes

- Resources
- Attributes
- Templates
- Definitions
- Libraries

Resources

- Cron
- Directory
- Execute
- File
- Group
- HTTP Request
- Link
- Mount
- Package
- Remote Directory
- Remote File
- Route
- Script
- Service
- Template
- User

Attributes

- Just JSON. No magic.
- Merged with the persisted node data at runtime.
- Can be overridden or have defaults set in roles/recipes.
- ```
{ "haproxy": { "port": "8000" } }
```

```
node[:haproxy][:port] #=> 8000
```

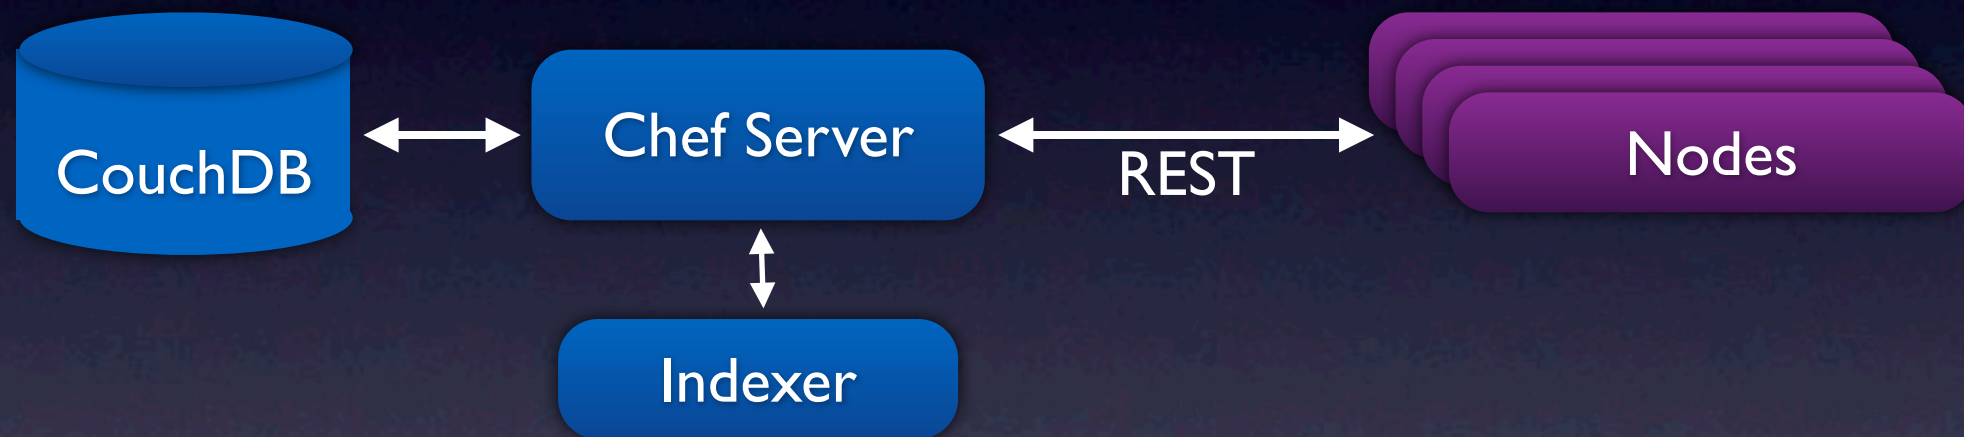

# Templates

- Plain old ERB files. Variables are usually bound to the node attributes.
- Contrived example: /etc/sudoers

```
Grant sudo access to the following group:
%<%= node[:sudo][:admin_group] %> ALL=(ALL) ALL
```

# Moving Parts

# Ohai!

```
{
 "kernel": {
 "machine": "x86_64",
 "name": "Linux",
 "os": "GNU/Linux",
 "version": "#1 SMP Wed Apr 1 21:34:13 UTC 2009",
 "release": "2.6.27-11-server"
 },
 "platform_version": "8.10",
 "platform": "ubuntu",
 "ipaddress": "192.168.2.85",
},
"network": {
 "eth0": {
 "flags": [
 "UP",
 "BROADCAST",
]
 }
}
```

Stop. Demo Time.
